

CARE, MAINTENANCE AND SAFETY INSTRUCTIONS

FOR COMPOSITE CO-EXTRUSION FENCES

- In most cases, occasional cleaning with water and soap is sufficient to maintain the appearance of your fence. To clean the affected area, start by rinsing your fence with a garden hose to remove any surface debris. Then, use warm soapy water and a soft-bristle brush to remove dirt and debris from the textured pattern, scrubbing along the grain for best results.
- You can use a pressure washer that has an adjustable nozzle and a soap dispenser to remove dirt or mud from your fence, provided that the pressure washer does not exceed 3000 psi. To clean the fence, begin by spraying it with soap, then use a soft-bristle brush to gently scrub each board. Rinse each individual board with a fan-shaped water jet nozzle, keeping it no closer than 10 inches (approximately 25 cm) from the surface of the fence.
- Exercise caution when handling steel-edged items near the fence.
- Use caution when operating lawnmowers and mechanical scythes in close proximity to the fence.
- Do not apply paint, stain, or other coating materials, including cleaners or pesticides, to the fence.
- Clean oil or grease spills as quickly as possible, preferably within seven days. Start by rinsing with a garden hose and use warm soapy water and a soft-bristle brush. If necessary, you can use recommended all-purpose cleaners, including those suitable for composite materials, and carefully follow the manufacturer's instructions.
- Avoid leaning heavy objects against the fence, as this may cause deformation.
- If mold is present, you can use a garden hose and warm soapy water with a soft-bristle brush. If needed, you can use recommended cleaners, including those designed for mold, and carefully follow the manufacturer's instructions.
- Do not install an automatic watering system that directly sprays water onto the fence, especially in direct sunlight and for an extended period. This could cause white spots and/or discoloration of the product where the water hits directly.

- When installing a BBQ, it is important to assess its thermal radiation and ensure it is positioned at a safe distance from all construction materials, including the fence. It should be noted that not all BBQs are the same, and homeowners may need to re-evaluate the BBQ's placement based on the amount of heat generated.
- Avoid direct water projection from an automatic watering system directly onto the composite board or other parts of the fence, as this water can cause permanent stains where it impacts the surface.
